

Project Summary

Municipal Biodiesel Production – Auburn University

Auburn University (AU) will develop a pilot program for biodiesel production and municipal vehicle fleet use in one Alabama municipality with recycled cooking oils as the primary feedstock. Operating costs and performance data will be collected and analyzed and made available to the public through AU and Alabama Cooperative Extension webpages. Extension materials will be developed to guide other municipalities in the development and implementation of similar programs. An extension field day will be conducted near the conclusion of the project, during August 2008, to highlight the results of the program.
